

# BottomLine ERP

## The Simple ERP for Small & Mid-Size Manufacturers

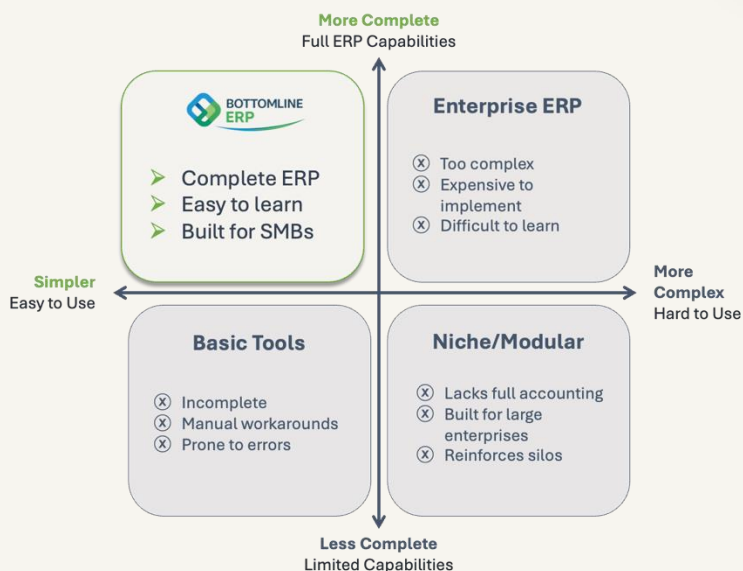

ERP software shouldn't be hard.

Small manufacturers often outgrow basic accounting tools and spreadsheets before they are ready for enterprise ERP. Inventory, purchasing, production, sales, and finance start to split across separate systems, creating reporting delays, reconciliation work, and operational risk.

BottomLine was built for that gap.

BottomLine brings accounting, inventory, warehouse management, procurement, planning, production, sales, trade management, fixed assets, and financial reporting together in one Salesforce-native platform. The system keeps everyday work simple by handling the complex downstream activity automatically.

### Operational action → financial record

Every purchase, receipt, inventory movement, work order, shipment, invoice, payment, and journal entry produces a traceable accounting impact. Operations and finance stay aligned without duplicate entry or month-end archaeology.

### Built natively on Salesforce

Customers get enterprise infrastructure without taking on enterprise overhead: Salesforce hosting, security, scalability, AppExchange extensibility, and a platform that stays current without version migrations.

Simple where it should be.  
Powerful where it matters.

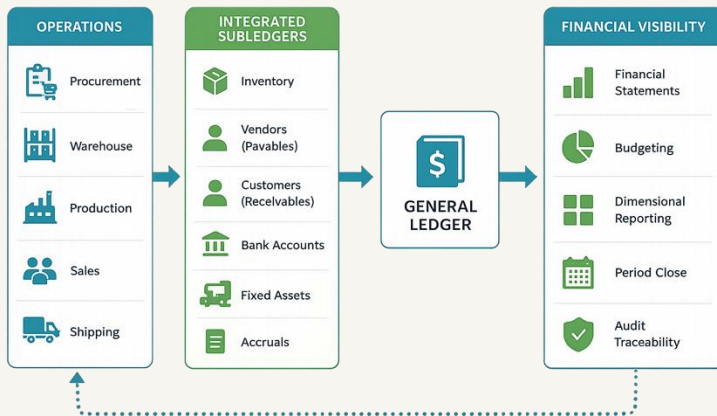

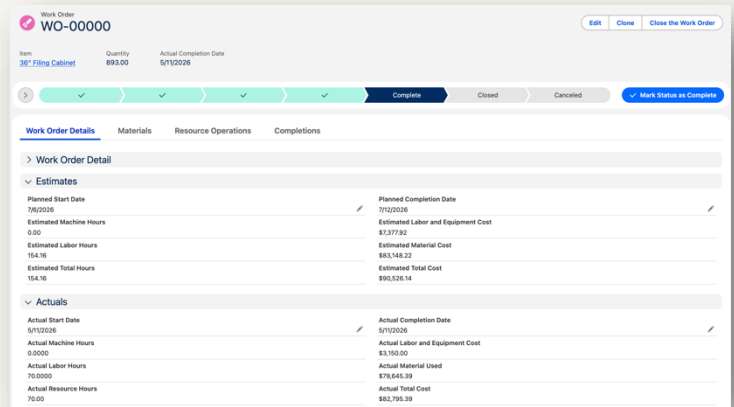

A complete ERP built for the teams who need operational depth without enterprise complexity.

# Why BottomLine ERP

## A Connected Platform for the Whole Business

### BottomLine is different

BottomLine is designed around the way smaller manufacturers actually operate: lean teams, overlapping roles, practical controls, and a need for real-time visibility. Instead of forcing users into rigid enterprise workflows, BottomLine uses guided, setup-driven processes that reduce training burden and strengthen auditability.

### From initial demand to financial close – fully connected.

Forecasts, sales orders, MRP, purchasing, work orders, inventory, shipments, invoicing, bank activity, subledgers, and the general ledger all operate in one system of record. The result is fewer handoffs, less reconciliation, and better visibility across operations and finance.

### Ready for early adopters

The core platform exists and is fully functional, with operational ERP modules, documentation, testing, onboarding structure, and SMB-focused pricing starting at \$24K per year for up to five users.
